

What you are offering them

A free listing on a map of local businesses that take crypto, plus offers they run themselves. A customer claims one, shows a code at the register, you scan it, and the screen tells you what to charge. XIT21 never touches the money.

- **It is free.** Listing costs nothing and is not tied to how they get paid.
- **They control the offer.** They write it, set how long it runs, end it whenever.
- **They get the numbers.** How many claimed it, and how many actually turned up.

In the shop, in order

- 1 Sign in on your phone**
xit21.com/admin - magic link to your email. Do this before you walk in; the link takes a minute to arrive.
- 2 Tap Sign a shop**
Type the business name, tap Find, pick them from the list. Fills the address and pins them in one tap.
- 3 If Google has never heard of them**
Search the street address instead. Still nothing? Stand inside and tap 'Pin where I am standing'.
- 4 Set what they take, then sign them up**
Settles in, also takes, hours note, owner's email. Live the moment you tap it, with their own exit number.
- 5 Show them the setup codes**
Two QR codes on screen. Left one goes on the terminal, below. The owner scans the right one.
- 6 Put their first offer up together**
From the owner's Offers tab. A shop with nothing running is a pin nobody taps.
- 7 Test it in front of them**
Claim it on your phone, scan it on their terminal, let them watch the total come out.

Putting the register on their NectarPay terminal

The terminal is an Android with a browser. Nothing to download, no app store, about a minute.

- 1 Open Chrome on the terminal**
Not the payment app - the browser.
- 2 Point its camera at the LEFT code**
Tap the link that pops up.
- 3 Menu, then Add to Home screen**
Three dots, top right. Tap Add.
- 4 Open it from the home screen**
Full screen, no address bar.
- 5 Allow the camera when it asks**
Say yes once, or it cannot read a pass.
- 6 Scan a real pass to finish**
Watch the total come out in front of them.

If the camera will not scan: type the six-character code from the customer's screen instead. It is on the register page under the scan button and works exactly the same. There is never a reason to turn someone away.

Do not get these wrong

- The **owner code** is the shop's takings. Give it to the owner, in person - never leave it on the counter.
- The **register code** only scans passes. That is the one that goes on the terminal.
- If a code gets out, the owner replaces the register link themselves from their Offers tab.
